1) Planning

A vehicle management plan (VMP) is a system to organise your internal traffic flow in a way that balances the safety and efficiency of your operation. Any static premise that has multiple vehicles or plants interacting with each other and pedestrians – e.g. logistics warehouses, open material yards or fleet vehicle parking – needs to have a robust system in place that clearly shows how these interactions will be managed.

A VMP will use physical infrastructure to delineate plant and pedestrian movements safely. In areas where plant and pedestrian interaction is unavoidable, then procedural systems will be developed and risk assessed to ensure that those interactions are managed as safely as possible without being a hinderance. Think of it as a Road Code for your premises.
