

1) Scalability

To enhance scalability in a vehicle management system using Salesforce, consider optimizing database queries, leveraging Salesforce's platform scalability features, and adopting efficient coding practices. Additionally, explore asynchronous processing for resource-intensive tasks and ensure proper data indexing. Regularly monitor system performance to identify potential bottlenecks and address them proactively.

2) Future plan

Creating a vehicle management system on Salesforce involves designing a custom application to track and manage vehicles, maintenance, and related data. You can use Salesforce's custom objects, workflows, and automation tools to build a comprehensive solution. Consider integrating with IoT devices for real-time data and leveraging Salesforce's reporting features for analytics. Regularly update and refine the system based on user feedback and evolving business needs.
